

**AMENDMENTS TO THE SPECIFICATION**

**IN THE ABSTRACT**

Please amend the abstract as follows:

A method is provided for generating mapping schemes for creating target electronic documents with data from a source, and for storing data from source electronic documents into a target. ~~Information about the attributes of the source is read in a source data definition, and information about the attributes of the target is read in a target data definition.~~ Commands from a user are then received creating a mapping between the attributes of the source and the attributes of the target. Multiple attributes of the source may be mapped to a single attribute of the target, and multiple attributes of the target can be mapped to a single attribute of the source. Commands, specifying actions to be performed when data from the source is converted to the target, may also be received from a user. A mapping scheme is then generated using ~~the source and target data definitions,~~ the mapping between the source and target attributes, and the actions defined on the source and the target. ~~The mapping scheme can then be used to create a target electronic document with data from the source, or to store data from a source electronic document into the target.~~
